

# FOOD GLORIOUS FOOD?

The pressures of a growing population and improved living standards in the developing world means a demand for more food – particularly protein-rich foods that put pressure on water and land availability.

The demand for more food has led to a greater awareness of these challenges and the need for scientific and engineering solutions to food production.

Chemical and biochemical engineers are working with agricultural industry to solve problems throughout the global food chain, to meet demand for sufficient, safe food without increasing energy, water or land use, as well as minimising waste production and environmental impact.

## Chemical Engineering Matters
