

WATER, WATER EVERYWHERE...

More than a billion people lack access to a clean, safe, treated water supply. Population growth and industrialisation are putting increasing pressure on already stretched supplies.

Water shortages are being caused by a wide range of factors. Environmental problems such as pollution, climate change and waste management all need to be looked at in order to improve the safety of drinking water for global communities.

Different countries have different needs, demands and challenges, however chemical and biochemical engineers will play a vital role in improving water quality by developing more efficient process technologies and practices.

Chemical Engineering Matters
