

# What is chemical engineering?

Chemical engineering is developing, improving and innovating sustainable processes to transform raw materials into a wide range of everyday products. Such processes are designed to be safe, environmentally friendly and cost-effective.

Chemical engineers work all over the world in industries such as:

- environment
- food and drink
- mining and minerals
- energy including renewables
- pharmaceuticals
- water
- cosmetics and household products
- manufacturing of fibres to be used in the fashion industry
